What the article reports

Rapportian reports that Omelet’s “Ssuk-scheduler” generates a draft nurse roster within 90 seconds and supports conversational revisions. The article describes ongoing validation in a ward at an unnamed Korean university hospital and a planned KHF 2026 demonstration.

PITCH CLAIM	SCOPE OF PUBLIC EVIDENCE
90-second scheduling time	Supports the reported maximum time for draft generation. It does not measure the entire approval/revision process.
2 weeks → 90 seconds	Omelet confirms the two-week manual-planning reference. The article publicly supports the 90-second draft-generation figure; it does not measure the full approval/revision cycle. Customer workflow records remain confidential.
CAU Hospital	The hospital is anonymous in the article. The supplied Omelet summary identifies it as CAU Hospital; this is company identification, not independent naming by the publisher.
Paid production deployment	Company-confirmed in the pitch. The August article describes field validation at that time; customer-level commercial/operating records are not published.
