

NVIDIA integration and product architecture

T5 · Slides 4–7 and 9 · Present scope, integration work and roadmap

COMPONENT / PRODUCT	STATE IN THE SUBMITTED DECK	EVIDENCE AND BOUNDARY
CUDA foundation training / test-time search	Integrating	<u>Architecture</u> ; no customer-production CUDA logs/configs attached. Not yet verified as shipped adoption.
cuOpt behind the OCP solver contract	Integrating, VRP first	<u>Integration plan</u> ; <u>MILP</u> , <u>GS Retail</u> , <u>Solomon</u> experiments. Standalone benchmark results do not prove an integrated, shipped backend.
LP / MIP integration	Next	A standalone MILP experiment can coexist with future OCP LP/MIP integration. No completed integration claim is made here.
Isaac Sim	Future / next phase	Roadmap only. No shipped-use evidence supplied.
OI Factory, OI Studio, OI Foundry; OCP / OIP	Product architecture and workflow	<u>Production workflow</u> ; <u>OCP / OIP diagram</u> . Deck illustrations show intended roles; they do not independently establish all functions in customer use.

Architecture from the submitted pitch

Original slide 5, captured from the supplied deck.

Claim boundaries

The deck's zero-hard-violation and KPI-at-least-baseline statements describe its validation gate; per-customer acceptance records are not attached. Example questions such as reducing nurse overtime by 15% and animation counters are illustrative, not measured outcomes or audited asset totals. Reuse, memory, governance and learning capabilities require execution/deployment evidence to qualify as shipped customer-product claims.

Factory creates validated capabilities; Studio supports exploration and analysis; Foundry assembles customer applications. Customer users operate the resulting applications. These roles are kept distinct from the OCP / application-kit assets and OIP operating infrastructure.
