## Reported outcome

2 wks → 1.5 hrs — box-optimization time · packing 40 ms → 0.8 ms

Catalog simulation: two weeks to 1.5 hours. Per-order packing computation: 40 ms to 0.8 ms. Fill ratio: 52.5% to 57.5% (5 percentage points). These are different metrics.

## Problem and solution

Use the smallest compliant box and stop wasting packaging.  
Meet over-packaging regulation and cut packaging cost through automated box-size optimization.  
Model / method: Bin-packing solver.

## Comparison and measurement scope

Customer test data, three box types; existing workflow versus optimized box selection.  
Source: Omelet case-study portfolio. Public summary prepared 17 September 2026. Underlying measurement dates, raw logs and detailed customer analysis are confidential. These are customer-project results; NVIDIA cuOpt use is not inferred.

## Implemented delivery

A box-sizing service that re-runs whenever the product mix or box catalog changes, and picks the right box for each order in real time.  
Delivery form: Box-sizing solver (API), Simulation workbench.
