| Variety Retailer I | Packing    | Projection + project validation |

## Reported outcome

≈ \$660K / yr — projected savings with a tailored algorithm

Approximately \$660K/year is projected savings, not booked revenue or realized annual savings. Test results: 8% less packaging-material area; 66% less box-selection time.

## Problem and solution

Pick the right box every time, so nothing is lost or over-packed.

Minimize packing inefficiency — component loss, void space, worker dependence — with AI real-time optimal box selection that accounts for nesting.

Model / method: Nesting + bin-packing.

## Comparison and measurement scope

Standard/small-item postal-box test versus worker-selected boxes.

Source: Omelet case-study portfolio. Public summary prepared 17 September 2026. Underlying measurement dates, raw logs and detailed customer analysis are confidential. These are customer-project results; NVIDIA cuOpt use is not inferred.

## Implemented delivery

A real-time API the packing line calls to get the right box for every order, as it is packed.

Delivery form: Real-time box-recommendation API.
